

# NumeriCheck

A service bringing real-time phone number intelligence to help prevent a multitude of fraud types.

## Real-Time Number Verification

The NumeriCheck API returns phone number data in milliseconds. This underpins real-time flows like transmission of messaging or voice traffic, verification of financial transactions, and registration of user accounts.

## DNO Data (Do-Not-Originate)

Evaluating in real-time if a phone number is a valid message sender ID or voice caller ID. This enables communication service providers to protect their networks and comply with the FCC DNO requirements, including the Report and Order targeting unlawful text messages.

## Smart Logic

A true global service that evaluates a broad set of data points in real time to ensure customers benefit from comprehensive, up-to-date information. NumeriCheck customers are one step ahead.

# NumeriCheck

## User Account Verification

NumeriCheck enables customers to strengthen their account verification upon new user registration. In the case of an invalid phone number, the customer can adapt the registration workflow by prompting the user to check the phone number format or by adding a CAPTCHA step for authentication.

## Traffic Routing

Service Providers can save some of the cost of terminating SMS or voice calls by checking if the receiving phone numbers are valid. They can also use NumeriCheck to implement the FCC requirements for stopping unlawful messaging.

## Fraud Prevention

Risk scoring of telephone numbers is essential for fraud prevention purposes. With NumeriCheck, fraud prevention algorithms can attach a higher risk to invalid numbers.
